

CLAIMS

The diaper-changing station holds a baby's legs in proper position and raises the legs and buttocks while the diaper is being changed.

A piece of furniture has a horizontal wall with a pad that resting on top. It has two rods with stirrups on the ends of the rods, which hold a baby's legs in place. The foot pedal connected to the lever raises the rods when it is depressed.

The diaper-changing station claim 1 is the raising mechanism, the rods with stirrups on it and the foot pedal to raise the rods with the baby's legs in stirrups.

The diaper-changing station claim 2 is to have a convenient diaper-changing table, which can hold the child's legs in place so that the child doesn't squirm out of position and an adult can use both of his/her hands to remove the dirty diaper, clean the baby and easily reach other needed things during the diaper-changing process.
